# R Package diagram: visualising simple graphs, flowcharts, and webs

# Karline Soetaert

Centre for Estuarine and Marine Ecology Netherlands Institute of Ecology The Netherlands

#### Abstract

This document describes how to use the **diagram** package (Soetaert 2009a) for plotting small networks, flow charts, and (food) webs.

Together with R-package shape (Soetaert 2009b) this package has been written to produce the figures of the book (Soetaert and Herman 2009b)

Keywords: diagram, food web, flow chart, arrows, R.

# 1. Introduction

There are three ways in which package diagram can be used:

- function plotmat takes as input a matrix with transition coefficients or interaction strengths. It plots the corresponding network consisting of (labeled) boxes (the components) connected by arrows. Each arrow is labeled with the value of the coefficients.
- function plotweb takes as input a matrix with (flow) values, and plots a web. Here the
  components are connected by arrows whose thickness is determined by the value of the
  coefficients.
- Flowcharts can be made by adding separate objects (textboxes) to the figure and connecting these with arrows.

Three datasets have been included:

- Rigaweb, the planktonic food web of the Gulf of Riga (Donali, Olli, Heiskanen, and Andersen 1999).
- Takapotoweb, the Takapoto atoll planktonic food web (Niquil, Jackson, Legendre, and Delesalle 1998).
- Teasel, the transition matrix describing the population dynamics of Teasel, a European perennial weed ((Caswell 2001; Soetaert and Herman 2009b).

The food webs were generated using R packages **LIM** and **limSolve** (Soetaert, Van den Meersche, and van Oevelen 2009; Soetaert and van Oevelen 2009) which contain functions to read and solve food web problems respectively.

# 2. plotmat - plotting networks based on matrix input

This is the quickest method of plotting a network. The network is specified in a matrix, which gives the magnitudes of the links (from columns to rows).

The position of the elements (boxes) is specified by argument pos. Thus, setting pos=c(1,2,1) indicates that the 4 elements will be arranged in three equidistant rows; on the first row one element, on the second row two elements and on the third row one element.

# 2.1. Simple examples

Below are some simple examples of the use of plotmat. In the first graph - four simple boxes are put; no arrows drawn

The second graph contains round boxes with arrows, labeled "flow"

The third graph has diamond-shaped boxes including self-arrows.

The fourth graph has hexagonal-shaped boxes, with curved arrows. The arrows are enlarged and the arrowhead pointing from box 2 to 4 is colored red.

```
> par(mar=c(1,1,1,1),mfrow=c(2,2))
> #
> #
> names <- c("A", "B", "C", "D")
> M <- matrix(nrow=4,ncol=4,byrow=TRUE,data=0)
> pp<-plotmat(M,pos=c(1,2,1),name=names,lwd=1,box.lwd=2,cex.txt=0.8,</pre>
              box.size=0.1,box.type="square",box.prop=0.5)
> #
> #
> M[2,1]<-M[3,1]<-M[4,2]<-M[4,3] <- "flow"
> pp<-plotmat(M,pos=c(1,2,1),curve=0,name=names,lwd=1,box.lwd=2,cex.txt=0.8,</pre>
              box.type="circle",box.prop=1.0)
> #
> #
> diag(M) <- "self"
> pp<-plotmat(M,pos=c(2,2),curve=0,name=names,lwd=1,box.lwd=2,cex.txt=0.8,</pre>
              self.cex=0.5, self.shiftx=c(-0.1, 0.1, -0.1, 0.1),
              box.type="diamond",box.prop=0.5)
> M <- matrix(nrow=4,ncol=4,data=0)</pre>
> M[2,1]<-1
            ;M[4,2]<-2;M[3,4]<-3;M[1,3]<-4
> Col <- M
> Col[] <- "black"
> Col[4,2] <- "darkred"
> pp<-plotmat(M,pos=c(1,2,1),curve=0.2,name=names,lwd=1,box.lwd=2,cex.txt=0.8,
              arr.type="triangle",box.size=0.1,box.type="hexa",box.prop=0.25,
```

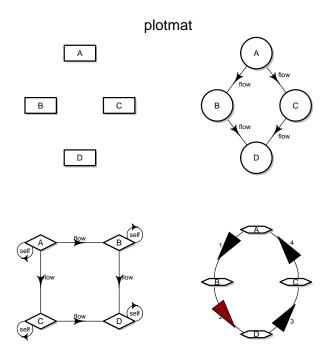

Figure 1: Four simple examples of plotmat

```
+ arr.col=Col,arr.len=1)
> mtext(outer=TRUE,side=3,line=-1.5,cex=1.5,"plotmat")
> #
> par(mfrow=c(1,1))
```

# 2.2. a schematic representation of an ecosystem model

In the example below, first the main components and arrows are drawn (plotmat), and the output of this function written in list pp. This contains, a.o. the positions of the components (boxes), arrows, etc.. It is used to draw an arrow from the middle of the arrow connecting fish and zooplankton ("ZOO") to detritus. Function straightarrow (see below) is used to draw this arrow.

```
> names <- c("PHYTO","NH3","ZOO","DETRITUS","BotDET","FISH")
> M <- matrix(nrow=6,ncol=6,byrow=TRUE,data=c(
+ # p n z d b f
+ 0,1,0,0,0,0, #p
+ 0,0,4,10,11,0, #n
+ 2,0,0,0,0,0, #z
+ 8,0,13,0,0,12,#d
+ 9,0,0,7,0,0,#b
+ 0,0,5,0,0,0 #f
+ ))</pre>
```

```
> #
> pp<-plotmat(M,pos=c(1,2,1,2),curve=0,name=names,lwd=1,box.lwd=2,cex.txt=0.8,
               box.type="square",box.prop=0.5,arr.type="triangle",
               arr.pos=0.4,shadow.size=0.01,prefix="f",
               main="NPZZDD model")
> #
> phyto
          <-pp$comp[names=="PHYTO"]</pre>
          <-pp$comp[names=="Z00"]
> zoo
> nh3
          <-pp$comp[names=="NH3"]</pre>
> detritus<-pp$comp[names=="DETRITUS"]</pre>
          <-pp$comp[names=="FISH"]</pre>
> fish
> #
> # flow5->detritus
> m2 <- 0.5*(zoo+fish)
> m1 <- detritus
> m1[1] <- m1[1] + pp$radii[4,1]</pre>
> mid <- straightarrow (to=m1,from=m2,arr.type="triangle",arr.pos=0.4,lwd=1)</pre>
> text(mid[1],mid[2]+0.03,"f6",cex=0.8)
> #
> # flow2->detritus
> #
> m2 <- 0.5*(zoo+phyto)
> m1 <- detritus
> m1[1] <-m1[1] + pp$radii[3,1]*0.2</pre>
> m1[2] <-m1[2] + pp$radii[3,2]</pre>
> mid<-straightarrow (to=m1,from=m2,arr.type="triangle",arr.pos=0.3,lwd=1)</pre>
> text(mid[1]-0.01,mid[2]+0.03,"f3",cex=0.8)
```

# 2.3. Plotting a transition matrix

The next example uses formulae to label the arrows <sup>1</sup>. This is done by passing a data.frame rather than a matrix to function plotmat

<sup>&</sup>lt;sup>1</sup>This is now possible thanks to Yvonnick Noel, Univ. Rennes, France

# **NPZZDD** model

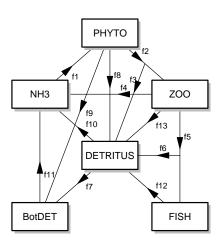

Figure 2: An NPZZDD model

# 2.4. Another transition matrix

The data set Teasel contains the transition matrix of the population dynamics model of teasel (Dipsacus sylvestris), a European perennial weed, (Caswell 2001; Soetaert and Herman 2009b)

### > Teasel

```
DS 1yr DS 2yr R small R medium R large F
DS 1yr 0.000 0.00 0.000 0.000 0.000 322.380
DS 2yr 0.966 0.00 0.000 0.000 0.000 0.000
```

# Age<sub>0</sub> Age<sub>1</sub> Age<sub>2</sub> Age<sub>3</sub> Age<sub>4</sub> Age<sub>5</sub> S<sub>0,1</sub> S<sub>1,2</sub> S<sub>2,3</sub> S<sub>3,4</sub> S<sub>4,5</sub>

# Age-structured population model 1

Figure 3: A transition matrix

R small	0.013	0.01	0.125	0.000	0.000	3.448
R medium	0.007	0.00	0.125	0.238	0.000	30.170
R large	0.008	0.00	0.038	0.245	0.167	0.862
F	0.000	0.00	0.000	0.023	0.750	0.000

This dataset is plotted using curved arrows; we specify the curvature in a matrix called curves.

# 3. plotweb - plotting webs based on matrix input

Given a matrix containing flow values (from rows to columns), function plotweb will plot a web. The elements are positioned on a circle, and connected by arrows; the magnitude of web flows determines the thickness of the arrow.

# **Teasel population model**

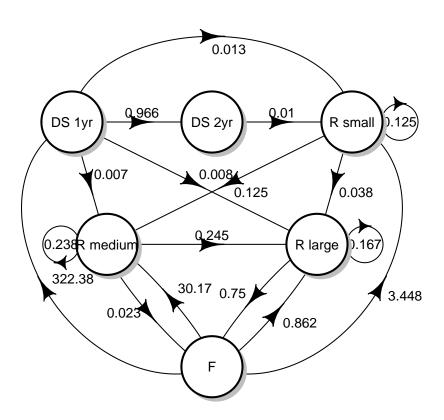

Figure 4: The Teasel data set

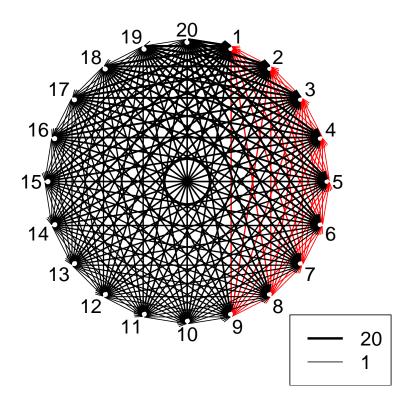

Figure 5: Plotweb

This function is less flexible than plotmat, although it does allow to color the arrows differently.

```
> BB <- matrix(nrow=20,ncol=20,1:20)
> diag(BB)<-0
> Col <- BB
> Col[] <- "black"
> Col[BB<10]<- "red"
> plotweb(BB,legend=TRUE,maxarrow=3,arr.col=Col)
> par(mfrow=c(1,1))
```

# 3.1. Foodwebs

Dataset Rigaweb ((Donali et al. 1999) contains flow values for the food web of the Gulf of Riga planktonic system.

# 4. functions to create flow charts

The various functions are given in table (1).

The code below generates a flow chart

```
> par(mar=c(1,1,1,1))
> openplotmat()
> elpos <-coordinates (c(1,1,2,4))
> fromto <- matrix(ncol=2,byrow=TRUE,data=c(1,2,2,3,2,4,4,7,4,8))</pre>
         <-nrow(fromto)
> arrpos <- matrix(ncol=2,nrow=nr)</pre>
> for (i in 1:nr)
      arrpos[i,]<- straightarrow (to=elpos[fromto[i,2],],from=elpos[fromto[i,1],]</pre>
          ,1wd=2,arr.pos=0.6,arr.length=0.5)
> textellipse(elpos[1,],0.1,
                                  lab="start",
                                                         box.col="green",
              shadow.col="darkgreen",shadow.size=0.005,cex=1.5)
> textrect (elpos[2,],0.15,0.05,lab="found term?", box.col="blue",
              shadow.col="darkblue",shadow.size=0.005,cex=1.5)
> textrect (elpos[4,],0.15,0.05,lab="related?", box.col="blue",
              shadow.col="darkblue",shadow.size=0.005,cex=1.5)
> textellipse(elpos[3,],0.1,0.1, lab=c("other","term"), box.col="orange",
              shadow.col="red",shadow.size=0.005,cex=1.5)
```

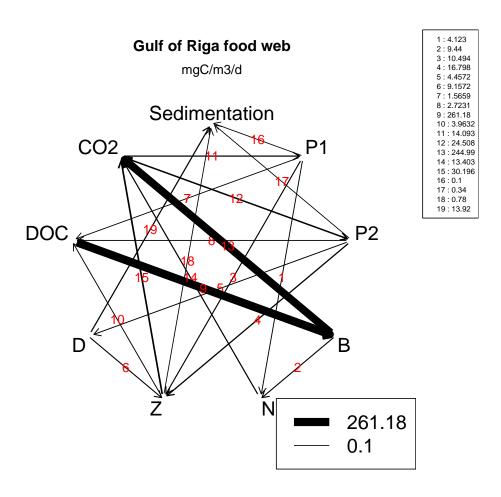

Figure 6: The Gulf of Riga data set

Table 1: Summary of flowchart functions

Function	Description			
openplotmat	creates an empty plot			
coordinates	calculates coordinates of elements, neatly arranged in rows/columns			
bentarrow	adds 2-segmented arrow between two points			
$\operatorname{curvedarrow}$	adds curved arrow between two points			
segmentarrow	adds 3-segmented arrow between two points			
selfarrow	adds a circular self-pointing arrow			
splitarrow	adds a branched arrow between several points			
straightarrow	adds straight arrow between two points			
treearrow	adds dendrogram-like branched arrow between several points			
shadowbox	adds a box with a shadow to a plot			
textdiamond	adds lines of text in a diamond-shaped box to a plot			
textellipse	adds lines of text in a ellipse-shaped box to a plot			
textempty	adds lines of text on a colored background to a plot			
texthexa	adds lines of text in a hexagonal box to a plot			
textmulti	adds lines of text in a multigonal box to a plot			
textplain	adds lines of text to a plot			
textrect	adds lines of text in a rectangular-shaped box to a plot			
textround	adds lines of text in a rounded box to a plot			

The different types of text boxes are generated with the following code:

```
> openplotmat(main="textbox shapes")
> rx <- 0.1
> ry <- 0.05
> pos <- coordinates(c(1,1,1,1,1,1,1),mx=-0.2)
> textdiamond(mid=pos[1,],radx=rx,rady=ry,lab=LETTERS[1],cex=2,shadow.col="lightblue")
> textellipse(mid=pos[2,],radx=rx,rady=ry,lab=LETTERS[2],cex=2,shadow.col="blue")
> texthexa(mid=pos[3,],radx=rx,rady=ry,lab=LETTERS[3],cex=2,shadow.col="darkblue")
> textmulti(mid=pos[4,],nr=7,radx=rx,rady=ry,lab=LETTERS[4],cex=2,shadow.col="red")
> textrect(mid=pos[5,],radx=rx,rady=ry,lab=LETTERS[5],cex=2,shadow.col="darkred")
```

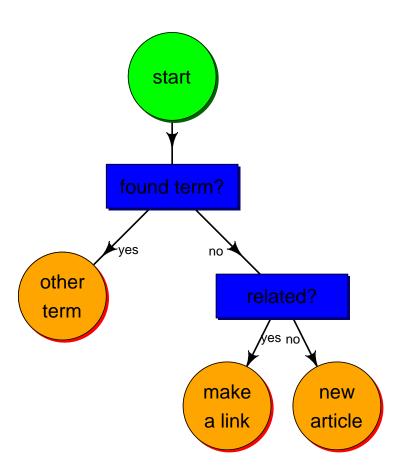

Figure 7: A flow chart

# textbox shapes

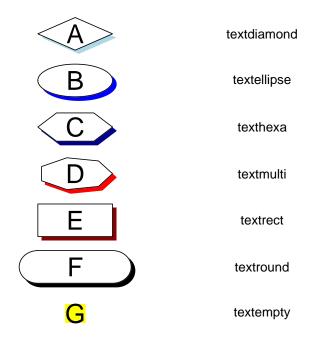

Figure 8: The text boxes

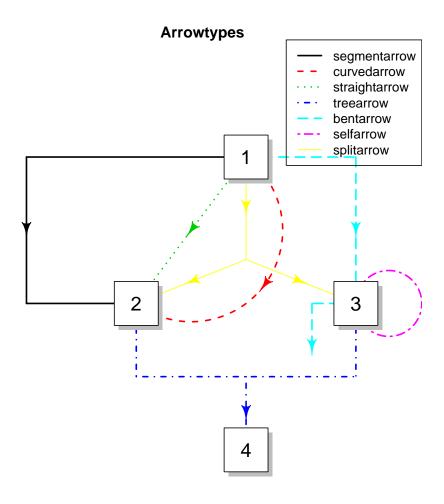

Figure 9: The arrow types

```
> selfarrow(pos=elpos[3,],path="R",lty=6,curve=0.075,lcol=6)
> splitarrow(from=elpos[1,],to=elpos[2:3,],lty=1,lwd=1,dd=0.7,arr.side=1:2,lcol=7)
> for ( i in 1:4) textrect (elpos[i,],0.05,0.05,lab=i,cex=1.5)
> legend("topright",lty=1:7,legend=c("segmentarrow","curvedarrow","straightarrow",
+ "treearrow","bentarrow","selfarrow","splitarrow"),lwd=c(rep(2,6),1),col=1:7)
```

This vignette was created using Sweave (Leisch 2002).

The package is on CRAN, the R-archive website ((R Development Core Team 2008))

More examples can be found in the demo's of package ecolMod (Soetaert and Herman 2009a)
